John Guest Underfloor Heating

What is a Manifold for Underfloor Heating?

The manifold is supplied with thermostatic option heads on the return and manually regulated flow gauges on the flow manifold. If individual control is needed, actuators can be mounted on the return manifold. The flow gauges on the flow manifold can easily be adjusted by using the key provided and adjusting the nut on the flow manifold before installing the actuators.

How do I operate the system?

You will have a room thermostat in each room, to set as you desire. In one room per floor

How is the pipe attached to the floor?

There are several methods of attaching underfloor heating pipes, Our most popular system is the Tacker system, where pipe is held in position with clips through the insulation. A wire grid system is available where pipework is held in place by cable ties affixed to the wire mesh. For joisted or batten floors we use a clip rail system where pipes are held by clipping into a plastic rail system. We have many other options available, please contact us for specific details.

Where do you install Edge insulation?

Edge insulation should be installed around all the perimeters of each room.

What are the lengths of each loop?

The pipe is marked every meter. This makes it very easy to check the length of each loop.

How do you lay the pipe?

Follow the AutoCad layout drawing which we will provided for every project.

What is the distance between pipe and walls?

The pipe distance from walls should be 100 mm.

What is the heat output?

Maximum heat output from screeded floors is approximately 100 W/m², the maximum heat output from timber suspended floor and floating floor is 70 W/m². With there being higher standards of insulation in new buildings, average heat requirements for many buildings are now below 60 W/m². For small bathrooms it is standard practice to also install warm water towel rails to give extra heat output as these areas are usually not very large.

How do you fill the underfloor heating system?

The underfloor heating system should be filled with water and fully vented of air. This can best be achieved using mains water pressure through the two end caps. All valves should be closed and the flow end cap connected with a hose to mains water, with the return end cap connected to a hose laid to waste water point. One by one flow and return valves are opened and closed on loop purging them of air.
